## ABSTRACT

Public cloud and private cloud domains combine together to form a platform known as hybrid cloud, which provides deployment methods to carry out various applications in different dimensions. In public hybrid cloud environments, many companies are facing issues in handling access control operations in shared infrastructures. Also, it lets the companies to choose where to place the loads to embrace audit and compliance policies. According to the recently conducted studies, hybrid cloud is vulnerable to malicious attacks and breaching of privacy. The main issues faced by the hybrid cloud are minimal security controls and risk management. This hybrid storage service has opened up scope for progress in the organizational development. The other limitations encountered could be accountability of shared responsibilities between both the stakeholders, internally and externally. With respect to these issues, this chapter aims at highlighting the privacy and compliance methodologies that are primarily necessary for efficient functioning of hybrid cloud storage. As a functional discipline, this chapter aims to bring out advanced privacy and security models for hybrid cloud models with state-of-the-art techniques.

### Abstract:

The solar photovoltaic system is extensively increased in grid integration as an alternative power generation due to its benefits. But still, the power grid withstands a notable challenge as overloading during the high penetration of photovoltaic power. These issues concern and give way out for an active power regulation by controlling the maximal photovoltaic power to the limited level. In this paper, a simple way of power-limiting control is proposed along with the maximal power point tracking for active power limit to the main grid. Howsoever, the proposed and conventional system is chosen with and without the active power control for the solar photovoltaic systems respectively. The performance of the proposed hybrid controller i.e maximum power point tracking controller along with power-limiting controller has been evaluated using MATLAB/Simulink environment. The Meta-heuristic beetle antenna search algorithm is employed for maximum power tracking with an active power controller. The control scheme provides the smooth operation between the maximum power tracking and power-limiting during fast varying irradiation conditions; also it has exposed the better performance of the proposed system than the conventional system. The trapezoidal profile simulation result differentiates the superior achievements of the hybrid controller and the illustration validates the ability of active power limit of the proposed system during the high power penetrations to the grid.

## ABOUT THE AUTHORS

Mr.S.Ramesh received B. Tech degree and M.E degree from Anna University, India. He is pursuing his PhD in Anna University, India reached out with Thesis Completion. He is currently working as an Assistant Professor, Computer Science Engineering, in Krishnasamy College of Engineering & Technology, S.Kumarapuram, Cuddalore. His Working Experience in Teaching as currently 12 Years ongoing. His research interest includes Wireless sensor networks, Embedded Systems.

Ms S. Dhivya received B.E degree from Annamalai University, India. She received M.E degree from Annamalai University, India. She is the gold medalist in the UG programme and got "Best outgoing student" award. She is pursuing her PhD at VIT University, India. Her research interest includes power system optimization and demand-side management.

Dr. C. Yaashuwanth received B. Tech degree from Anna University, India. He received M.E degree and PhD from the renowned Anna University, India. He has working experience of about seven years. He is currently working as an Associate Professor from the Department of Information Technology in Sri Venkateswara College of Engineering, India. He published more than 12 papers in International Journals and six articles in International conferences. His research interest includes Wireless Sensor Networks and Embedded system.

Ms K. Prathibanandhi (Kanagaraj Prathibanandhi) completed her B.E. degree in Electrical and Electronics Engineering at Anna University Chennai. She completed M.Tech at SRM University Chennai. At present, she is pursuing her PhD at Anna University, India reached out with Thesis completion. She is currently working as an Assistant Professor in the Department of Electrical and Electronics Engineering, from Saveetha School of Engineering, Saveetha University, Chennai, India.

### Abstract

The Myth of distributing multimedia content came to reality with the emancipation of Wireless Multimedia Sensor Networks (WMSNs). The proper management is needed to avoid the excessive packet drop during transmission of multimedia data over WMSNs. Existing QoS does not lead to increase in sensor nodes and volume of data in wireless sensor networks. This paper proposes to emphasize the QoS in WMSNs inspite of insubstantial flimsy Error Concealment (EC) scheme. The sustainable quality for retaining the receiving ends is the prime core for the Quality of Experience (QoE). The proposed key objectives of the edifice are to reduce the effects of leaped video packets and to maximize its network. The variable Quantization Parameters (QPs) are used to control the data rate at the multimedia sensor with Scalable High-efficiency Video Coding (SHVC). The real-time video transmission is exploited by the multipath routing. Experimental outcome reveals that the proposed edifice able to proficiently regulate network distortions under large volumes of video data and produce better objective measurements for lost video frames.
